The Characteristics Of RC Hammers

RC series reverse circulation DTH Hammer is the latest developed product of our company, it is mainly used for deep exploration drilling and stope ore grade control.

It has the following characteristics:

- ◆ Based on previous experience of ordinary hammers, combined with the features of reverse circulation hammer, optimized internal structure and ideal energy transfer, thus ensuring the series of hammers drilling with fast, smooth and continuous sampling.
- ◆ The internal structure is very simple with components of high rigidity, thus ensuring long life and easy maintenance of the hammer.
- ◆ The collection tube adopts an integrative design and can be replaced without disassembling the hammer. With carburizing treatment, it has good abrasive resistance.
- ◆ Equipped with bits designed with patent, simply by replacing the drill bit, the same hammer can drill holes of different sizes ensuring that the sample is not contaminated.
- ◆ In difficult conditions such as loose soil, hard rock and plenty of water exists, sampling can be done well.

Explanation of The characteristics of HRC Hammers

For Example :RC3-E531

- ◆ RC-Reverse Circulation DTH Hammer
- ◆ 3-Hammer item number
- ◆ E531-Drill Bits item number

Introduction of R.C. Drilling and R.C. DTH Hammers

It has the following characteristics:

- ◆ R.C. Drilling, referred to as "Center Sample Recovery" or "Dual Wall Drilling", employs a Dual Wall Pipe where the drilling medium, normally high pressure air, is passed between the outer and inner tubes down to the face of the drilling bit where it is returned up the centre tube along with the sample cut by the drill bit.

The use and the advantages of the R.C. DTH Hammers:

◆ No contamination

The R.C. System collects sample through the recovery holes in the face of the drill bit immediately as the cuttings or sample is formed. The drilled sample does not have to travel the length of the hammer where contamination and loss of sample takes place.

◆ Higher Production

In broken and fractured ground conditions, the R.C. will often out perform the conventional hammer in terms of penetration rates.

◆ Dry Sample

Even in certain water bearing stratas it is still possible to collect a dry sample because the cuttings(sample) are collected as they formed through the face of the drill bit.

◆ Higher Sample Recovery

Because the sample is collected through the face of the drill bit there is no loss of sample when drilling through broken or fractured ground. And since the bit matched to the chuck size, there is very little bypass of sample and recovery rates of up to 98% are generally achievable.

RC10-A R.C. HAMMER

10"R.C. Hammers	Item Description	Weight (Kg)	Part Number	
	1	"O" Ring	0.05	RC10-A-01
	2	Sample Tube	49.85	RC10-A-02
	3	Circlip	0.12	RC10-A-03
	4	Airscreen Top Load	2.25	RC10-A-04
	5	Top Sub	59.50	RC10-A-05
	6	Plunger	3.40	RC10-A-06

Reverse circulation pipes(dual wall drilling)

High pressure air transported into somewhere of the well along with air pip, via mixer to inject the high-pressure air into the pipe with liquid, due to the density of mixed liquor lower than the flushing liquor therefore a differential pressure occurred between pipe and sample tube that to make the mixed air and liquid follow up fleetly by the fluid column pressure and take the rock debris or power out to the ground from bottom of the hole continuously. By this drilling method will provide with advantages like high penetration rate, quality pore-forming and fewer hole collapse during drilling in loose formation.

This series reverse circulation pipes can increase penetration in lost-circulation formation, reduce drilling fluid consumption, protect reservoir stratum and save the cost of other consumption tools. In addition, the pipes can be worked in two direction circulation drilling ways to control the well drilling. By reverse circulation method to kill the well the heavy mud can be transferred directly to the bottom of the well, no periodic circulation and save time.

Type	external dia. of outer pipe (mm)	Inner dia. of inner pipe (mm)	thread of pipe	Length (mm)	sealing	Depth (m)	Marks
